

```
#Task -1
# Create two lists
list1 = [1, 2, 3]
list2 = [4, 5, 6]

# Concatenate or join the two lists
combined_list = list1 + list2

# Print the combined list
print(combined_list)
```

```
[1, 2, 3, 4, 5, 6]
```

```
#Task-2
# Create a list of numbers
numbers = [1, 2, 3, 4, 5, 6, 7, 8, 9, 10]

# Initialize an empty list to store the even numbers
even_numbers = []

# Iterate through the list and use an if statement to find even numbers
for num in numbers:
    if num % 2 == 0:
        even_numbers.append(num)

# Print the list of even numbers
print("Even numbers:", even_numbers)
```

```
Even numbers: [2, 4, 6, 8, 10]
```

```
#Task-3
# Create a dictionary with 3 keys, each having 2 values
student_grades = {
    "Alice": [92, 88],
    "Bob": [78, 84],
    "Charlie": [88, 90]
}

# Accessing the values for each student
alice_grades = student_grades["Alice"]
bob_grades = student_grades["Bob"]
charlie_grades = student_grades["Charlie"]

# Print the grades for each student
print("Alice's Grades:", alice_grades)
print("Bob's Grades:", bob_grades)
print("Charlie's Grades:", charlie_grades)
```

```
Alice's Grades: [92, 88]
Bob's Grades: [78, 84]
Charlie's Grades: [88, 90]
```

```
#Task-4
def find_odd_numbers(numbers):
    # Initialize an empty list to store the odd numbers
    odd_numbers = []

    # Iterate through the input list and use an if statement to find odd numbers
    for num in numbers:
        if num % 2 != 0:
            odd_numbers.append(num)

    return odd_numbers

# Example usage:
numbers = [1, 2, 3, 4, 5, 6, 7, 8, 9, 10]
odd_numbers = find_odd_numbers(numbers)
print("Odd numbers:", odd_numbers)
```

```
Odd numbers: [1, 3, 5, 7, 9]
```

```
#Task-5
def sum_numbers():
    num_list = [2, 7, 7, 3, 0]
```

```
total = sum(num_list)
print("Sum of the numbers:", total)

# Call the function to calculate and print the sum
sum_numbers()

Sum of the numbers: 19
```
